HYDROXAMIC ACID DERIVATIVES FOR USE WITH THE TREATMENT OF DISEASES RELATED TO CONNECTIVE TISSUE DEGRADATION

FIELD OF THE INVENTION

5 The present invention relates to novel hydroxamic acid derivatives or pharmaceutically acceptable salts thereof, their preparation, and pharmaceutical compositions containing them. Particularly, the present invention relates to hydroxamic acid derivatives substituted by a series of 2-pyrrolidinones, hydantions, and pyrazolidinones, which are useful in the treatment of diseases related to
10 connective tissue degradation.

BACKGROUND OF THE INVENTION

Loss of connective tissue integrity occurs in many disease processes, including osteoarthritis, rheumatoid arthritis, septic arthritis, osteopenias such as
15 osteoporosis, tumor metastasis (invasion and growth) periodontitis, gingivitis, corneal ulceration, dermal ulceration, gastric ulceration, and other diseases related to connective tissue degradation. Although there is a high incidence of these diseases in the developed world, there is no treatment that prevents the tissue damage that occurs. Considerable lines of scientific evidence indicate that
20 uncontrolled connective matrix metalloproteinase (MMPs) activity is responsible for the damage, and as a consequence the inhibition of these enzymes has become the target for therapeutic intervention (see Matrisian, L. M., Bases, Vol. 14, pp 445-463, (1992); Emonard, H. et al., Cellular and molecular Biology, Vol. 36, pp 131-153, (1990); Docherty, A. J. P. et al., Annals of the Rheumatic, Vol. 49, pp 469-479,
25 (1990)).

The compounds of the present invention inhibit various enzymes from the matrix metalloproteinase family, including collagenase, stromelysin, and gelatinase, and hence are useful for the treatment of matrix metallo endoproteinase diseases such as osteoarthritis, rheumatoid arthritis, septic arthritis, osteopenias such as
30 osteoporosis, tumor metastasis (invasion and growth), periodontitis, gingivitis, corneal ulceration, dermal ulceration, gastric ulceration, and other diseases related to connective tissue degradation. These compounds may also inhibit the release of cytokines including tumor necrosis factor (TNF α) and hence may also be useful in the treatment of inflammation, fever, acute infections and shock.

The present invention provides novel hydroxamic acid derivatives useful as preventatives and therapeutics for diseases related to connective tissue degradation.

DETAILED DESCRIPTION OF THE INVENTION

10 For the purpose of the present invention, the carbon content of various hydrocarbon containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, i.e., the prefix C_{i,j} defines the number of carbon atoms present from the integer "i" to the integer "j" inclusive. Thus, C₁₋₄ alkyl refers to alkyl of 1-4 carbon atoms, inclusive, or methyl, ethyl,
15 propyl, butyl and isomeric forms thereof.

The terms "C₁₋₆ alkyl", "C₁₋₁₀ alkyl" or "C₁₋₂₀ alkyl", refers to methyl, ethyl, n-propyl, n-butyl, n-pentyl, n-hexyl, etc. and isomeric forms thereof, and preferably an alkyl group having 1 to 6 carbon atoms.

The C₁₋₆ alkyl group may optionally be substituted by one or more
20 substituents selected from the group consisting of a halogen atom, a hydroxy group, or -CN group such as, for example, fluoromethyl, difluoromethyl, fluoroethyl, cyanomethyl and the like.

The term "C₃₋₆ cycloalkyl" refers to cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and isomeric forms thereof, and preferably an cycloalkyl group having 4
25 to 6 carbon atoms.

The term "halogen" refers to fluoro, chloro, bromo, or iodo, preferably fluoro and chloro.

The term "Q" refers to a saturated 5-, or 6-membered heterocyclic moiety having 1-2 atoms selected from the group consisting of nitrogen, oxygen, and sulfur
30 forming such groups as, for example, dioxolane, imidazolidine, dithiolane, oxathiolane, oxazolidine, piperidiny, piperaziny, morpholino and thiomorpholino.

The term "Het" refers to a 5-, 6-membered heteroaromatic moiety having one or more atoms selected from the group consisting of nitrogen, oxygen, and sulfur forming such groups as, for example, 2-thienyl, 3-thienyl, 2-pyridyl, 3-pyridyl, 4-
35 pyridyl, 2-pyrimidinyl, 4-pyrimidinyl, 5-pyrimidinyl, 3-pyridazinyl, 4-pyridazinyl, 3-pyrazinyl, 2-furanyl, 3-furanyl, 1-pyrrolyl, 2-pyrrolyl, 3-pyrrolyl, 1-pyrazolyl. A

preferred heteroaromatic ring within the definition is 2-thienyl and pyridyl.

Within the definition of the terms "Het", and "Q", the nitrogen atom forming the hetero rings may have a protective group such as an acetyl or hydroxyacetyl group.

5 The compounds of the present invention can be converted to their salts according to conventional methods.

 The term "pharmaceutically acceptable salts" refers to salts useful for administering the compounds of this invention and these include hydrochloride, hydrobromide, hydroiodide, sulfate, phosphate, acetate, propionate, lactate,
10 mesylate, maleate, malate, succinate, tartrate, citrate, 2-hydroxyethyl sulfonate, fumarate and the like. These salts may be in hydrated form. Some of the compounds of this invention may form metal salts such as sodium, potassium, calcium and magnesium salts and these are embraced by the term
"pharmaceutically acceptable salts".

15 Certain of the hydroxamic acid derivatives of the present invention are preferred.

 The preferred R_1 substituent is methylpropyl.

 The preferred R_2 substituent is H, methyl, 2-(1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(1,3-dihydro-1,3-dioxo-2H-naphthoisoindol-2-yl)ethyl, 2-(4,5,6,7,
20 tetrafluoro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(5,6-dichloro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(5-amino-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(4-nitro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(5-nitro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(4-fluoro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(4,7-difluoro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(5-
25 fluoro-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)ethyl, 2-(1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)propyl, 2-(1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl)methyl, 2-(2-thienylthio)propyl, or 2-(2-thienylthio)methyl.

 The preferred R_3 substituent is H, 2-methylpropyl, cyclohexylmethyl, benzyl, or phenyl.

30 The preferred R_4 substituent is H or acetamide.

 The preferred absolute configurations of the compounds claimed in the present invention are as represented in the structures II - VII. The absolute configurations are determined under the Cahn-Ingold-Prelog nomenclature system. The compounds depicted in the Examples are racemic unless indicated otherwise by
35 R or S to refer their optical activity. The pure enantiomers possess higher inhibitory activities. The racemic mixtures are useful in the same way and for the same

purpose as the pure enantiomer; the difference is that more racemic material may be used to produce the same inhibitory effect. Optically pure material can be obtained by using chiral HPLC methods to provide the corresponding enantiomers as illustrated in Examples 2, 5, and 28. Optionally, optically pure materials can be
5 obtained chemically to provide the desired enantiomer as illustrated in Examples 29-34.

Depending on substituents, the compounds of this invention may exist in geometric, optical and other isomeric forms and this invention embraces any of these isomers or enantiomers.

10 Particularly preferred compounds of this invention are as follows:

The compounds represented by the general formula I can be prepared by the methods of reaction in Schemes A-D.

- As shown in Scheme A-1, structure 2 is readily prepared from structure 1 (commercially available) according to the procedures described in J. Am. Chem. Soc. Vol. 75, 3679 (1953). Alkylation of structure 2 requires an alkyl group (R₁) attached to an appropriate leaving group. The alkylation occurs in the presence of a suitable base such as lithium diisopropylamide (LDA) at a suitable temperature in the range -78 °C to 5 °C to provide structure 3. The ester side chain of structure 4 is introduced by alkylation of 3 with an alkyl (R' = C₁₋₆ alkyl) bromoacetate in the presence of a suitable base such as LDA in a suitable solvent such as tetrahydrofuran (THF), at a suitable temperature in the range -78 °C to 0 °C. Hydrolysis of structure 4 by the procedures well known to one of ordinary skill in the art affords structure 5, which is then converted to the hydroxamate 6 by reaction of structure 5 with hydroxylamine hydrochloride and 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (EDC) as an acid activating agent at a suitable temperature in the range -20 °C to 20 °C. The reaction occurs in the presence of a catalyst such as 1-hydroxybenzotriazole hydrate (HOBT) and an appropriate acid scavenger such as N-methylmorpholine in a suitable solvent such as DMF, CH₂Cl₂ or a mixture thereof. Alternatively, alkylation of structure 4 with a halide compound I-R₂ (I is halogen, R₂ is defined as above) by procedures well known to one of ordinary skill in the art affords structure 7. For example,

alkylation of 4 with allyl bromide introduces an allyl group on the α -position of side chain using a suitable base such as LDA in a suitable solvent such as THF at a suitable temperature in the range -78°C to 25°C . The resultant allyl intermediate is then converted to the corresponding alcohol by ozonolysis and reduction NaBH_4 or
5 by hydroboration with 9-BBN. In many cases the alcohols are converted to a phthalimide via the Mitsunobu protocol. Alternatively, the alcohol can be converted to a leaving group (such as Ms, Ts) which is subsequently displaced with the desired nucleophile such as SR, NR_2 , OR, etc. The remaining synthetic steps which leads structure 7 to structure 9 is similar to that described above.

10 A slightly different approach is employed to prepare 16 as shown in Scheme A-2, which incorporates a terminal amide R_4 (R_4 is as defined above, except R_4 is not hydrogen). Alkylation of commercially available 10 affords lactam 11 according to the procedures described in Fisher, M. J. and Overman, L. E., J. Org. Chem., Vol. 55, pp 1447-1459 (1990). Lactam 11 is reacted with allyl bromide to provide 12.
15 The yields for this reaction are generally quite high. Alkylation of 12 with ethyl bromoacetate provides ester 13. Structure 13 is then converted to the corresponding amide 14, which followed by oxidation with ruthenium tetroxide in a solvent mixture such as carbontetrachloride, water, and acetonitrile at room temperature affords pyrrolidineacetic acid 15. The step which leads from structure 15 to
20 structure 16 is similar to that described above in Scheme A-1.

Scheme A-3 illustrates another method for preparing the compounds of formula I. As shown in Scheme A-3, reaction of structure 10 with di-tert-butyl dicarbonante in the presence of DMAP provided protected lactam 17. Alkylation of 17 with alkyl or alkenyl halides in the presence of HMPA provides lactam 18. The
25 ester side chain of structure 19 is introduced by alkylation of 18 with alkyl bromoacetate as described in Scheme A-1. Structure 19 can then be deprotected using magnesium methoxide in a suitable solvent according the procedure described in Tetrahedron Lett. Vol. 35, p 847 (1994) to provide structure 20. Alteratively, alkylation of 19 with a halide compound I-R_2 by procedures well known to one of
30 ordinary skill in the art affords structure 21. Deprotection of structure 21 affords structure 22. The R substituent can be introduced directly by N-alkylation of 20 or 22 with a desired halide compound using a suitable base such as sodium hydride in a suitable solvent such as THF or DMF to provide structures 4 or 7, respectively.

If desired, lactam 20 and 22 can be resolved using chiral HPLC or chemical
35 methods to provide the corresponding enantiomers as illustrated in Examples 2 and

28. Each antipode can be converted to the appropriate chiral analogs 20a and 22a as shown in Scheme A-4. Lactam 20 and 22, either as the racemate or a single enantiomer, are used in the alkylation steps as described in Schemes A-3 and A-4. As shown in scheme A-4, the alkylation of lactam 20a or 22a with the triflate 23 affords 24 and 28, respectively. For simplicity, only a single antipode of 20a or 22a and triflate 23 are presented. This chemistry can be carried out for both the racemate or a single enantiomer. Triflate 23 can be prepared following the procedure described in J. Org. Chem. Vol. 58, pp 2725-2737 (1993). A preferred approach to provide 24 involves deprotonation of 20a with a suitable base such as sodium hydride in a suitable solvent such as THF at a temperature in the range -20°C to 15 °C, followed by the addition of triflate 25. Warming to ambient temperature affords desired structure 24. If racemate 20 is utilized the diastereomers can be separated at this stage by silica gel chromatography or HPLC. Hydrolysis of the methyl ester 24 with aqueous NaOH provide 25, which following the formation of an amide by the procedure outlined in Scheme A-3, affords 26. The remaining synthetic steps which lead from structure 26 to structure 27 are similar to that described in Scheme A-1. In a similar fashion, the compounds represented by structure 31 are prepared.

Alternatively, an enantiospecific method can be employed to prepare a single antipode as shown in Scheme A-5. Alkylation of commercially available compound 32 requires an alkyl or allyl (R_1) attached to a leaving group in the presence of a suitable base such as lithium diisopropylamide (LDA) provides structure 33 as a mixture of diastereoisomers at the C-3 position of the ring. The mixture is alkylated with allyl bromide to provide 34 in optically pure form as shown in A-5. The trityl group is removed with TFA to provide 35, which is converted to lactol 36 following the protocol described in J. Chem. Soc. C.C. pp 1119-1122 (1989). The key cyclization step is effected quite simply by reaction of the lactol 36 with an amine 37 in the presence of sodium cyanoborohydride followed by heating the crude uncyclized intermediate at reflux in toluene to provide 38 as a single isomer. Amine 37 can be prepared through the conversion of a commercial available L-, or D-amino acid to the corresponding amine by procedures well known to one of ordinary skill in the art. Following the chemistry outlined in Schemes A-2, the olefin is oxidized with ruthenium tetroxide to provide 39, which is coupled with O-benzylhydroxylamine hydrochloride (CDI, THF) and then deprotected by hydrogenation with palladium on carbon to provide 41.

A series of other ring system are synthesized as shown in Schemes B-E. Scheme B illustrates a method for preparing 2,5-dioxo pyrrolidines. Exhaustive ruthenium tetroxide oxydation of 4 in the presence of sodium periodate in the suitable solvent such as water/acetonitrile/carbontetrachloride at an ambient
5 temperature provides 42. In a similar fashion as described in Scheme A-1, hydroxamate 43 is prepared.

Two different synthetic routes are developed for the synthesis of the hydantoin analogs as shown in Schemes C-1 and C-2. In Scheme C-1, N-alkylation of 1-methylhydantoin 44 with 2-bromoethylbenzene occurs in the presence of a
10 suitable base such as sodium hydride, in a suitable solvent such as DMF, at the temperature in the range -20°C to 15 °C. Following C-alkylation with a halide compound in the presence of a suitable base such as LDA at the temperature in the range -78°C to 15 °C affords 46. Formation of the quaternary center through C-alkylation with an alkyl bromoacetate in the presence of a suitable base such as
15 LDA at the temperature in the range -78°C to 15 °C affords 47. Conversion of 47 to the hydroxamate 48 is conducted following the previously outlined procedures. An alternative approach is developed for the synthesis of the unsubstituted (1-H) hydantoin analog of 48. Amino acid 49 can be prepared according to the procedures described in Dellaria, J. F., J. ORG. Chem. Vol. 53, p 5607 (1988). Following the
20 general procedure of Van der Veen, J.M. at el. J. C. S. Perkin II pp 653-658 (1979), amino acid 49 is reacted with an appropriate substituted isocyanate followed by cyclization under acidic conditions to provide hydantoin 50. The remaining synthetic steps which lead to structure 52 are similar to that described previously.

Scheme D illustrates an approach into a pyrazolidinone ring system.
25 Protection of pyrrazolidinone 53 by the procedures described in Perri, S. T. at el., J. Org. Chem., Vol. 55, pp 6037-6047 (1990) provides 54. Following N-alkylation and C-alkylations as outlined previously, lead to structure 57. An atmosphere of hydrogen is placed over a mixture of 57 and Pearlman's catalyst in a suitable solvent such as MeOH at ambient temperature to afford the desired compound 58.

30 The pharmaceutical compositions of this invention may be prepared by combining the compounds of formula I of this invention with a solid or liquid pharmaceutically acceptable carrier, and optionally, with pharmaceutically acceptable adjuvants and excipients employing standard and conventional techniques. Solid form compositions include powders, tablets, dispersible granules,
35 capsules and suppositories. A solid carrier can be at least one substance which may

also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water, water-propylene glycol, and water-polyethylene glycol systems, optionally containing conventional coloring agents, flavoring agents, stabilizers and thickening agents.

10 The pharmaceutical composition is provided by employing conventional techniques. Preferably the composition is in unit dosage form containing an effective amount of the active component, that is, the compounds of formula I according to this invention.

15 The quantity of active component, that is the compounds of formula I according to this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application method, the potency of the particular compound and the desired concentration. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

20 In therapeutic use for treating a patient, suffering from or susceptible to a diseases involving connective tissue degradation, or inhibiting various enzymes from the matrix metalloproteinase family, including collagenase, stromelysin, and gelatinase, the compounds or pharmaceutical compositions thereof will be administered orally, parenterally and/or topically at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the patient undergoing treatment which will be effective to inhibit such enzymes. Generally, an effective amount of the active compound will be in the range of about 0.1 to about 100 mg/kg. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of connective tissue degradation being treated, and the particular compounds being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

The compounds of the present invention inhibit various enzymes from the matrix metalloproteinase family, including collagenase, stromelysin, and gelatinase, and hence are useful for the treatment of matrix metallo endoproteinase diseases such as osteoarthritis, rheumatoid arthritis, septic arthritis, osteopenias such as
5 osteoporosis, tumor metastasis (invasion and growth), periodontitis, gingivitis, corneal ulceration, dermal ulceration, gastric ulceration, and other diseases related to connective tissue degradation. Such diseases and conditions are well known and readily diagnosed by physician of ordinary skill.

These compounds may also inhibit the release of cytokines including tumor
10 necrosis factor (TNF α) and hence may also be useful in inflammation, fever, acute infections and shock. In general, the preferred form of administration is orally.

Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compounds according to formula I as a soluble salt (acid addition salt or base salt) dissolved in a
15 pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a suitably buffered isotonic solution having a pH of about 3.5-6. Suitable buffering agents include, for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine, to name a few. The compounds according to formula I generally will be dissolved in
20 the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml. The resulting liquid pharmaceutical composition will be administered so as to obtain the above-mentioned inhibitory effective amount of dosage. The compounds of formula I according to this invention are advantageously administered orally in solid and
25 liquid dosage forms.

Inhibitory activity is evaluated in one or more of the MMP enzymes (stromelysin, gelatinase, and collagenase) in vitro using a particle concentration fluorescence techniques. An inhibitor binds to MMP enzymes prevents the degradation of a substrate of stromelysin, gelatinase, or collagenase. The substrate
30 is attached with a fluorescein and a biotin. The intact substrate then binds to an avidin-coated particle via the biotin moiety. Once the particle is washed and dried, a fluorescent signal is generated since the fluorescent group is attached to the particle. Without an inhibitor present, the substrate is degraded by MMP enzymes and the fluorescein group is removed, therefore, no fluorescent signal can be
35 detected. Testing compounds are dissolved in DMSO to the desired concentration, then the solutions are diluted to 1:5 with MMP buffer (50 mM Tris-HCl, pH 7.5; 150

mM NaCl; 0.02% NaN_3). Serial two-fold dilutions of each compound are prepared. A concentrated, activated enzyme solution is transferred into each plate of the testing compounds, and the mixture is incubated at room temperature for 15 minutes. Thawed MMP substrate is then added into all plates, and the plates are incubated in the dark for 1-3 hours at room temperature. At this point, the substrate mixture is reacted with 0.1% avidin-coated polystyrene particles. After 15 minutes, the inhibitory activities are evaluated by K_i assay. Inhibitory data for the compounds of this invention are shown in TABLE 1. Compounds with lower K_i value are expected to be more effective as MMP inhibitors. It is expected that a compound with a K_i less than 15 μM against any one of the MMP's will display therapeutic effects in connective tissue disorders.

Example 1 Preparation of N-Hydroxy-3-(2-methylpropyl)-2-oxo-1-(2-phenylethyl)-3-pyrrolidineacetamide.

Step 1. Preparation of 1-(2-Phenylethyl)-2-pyrrolidinone.

Following the procedure of Boekelheide and Godfrey (J. Am. Chem. Soc. 1953, 75, 3679), γ -butyrolactone (50.0 mL, 650 mmol) and phenethylamine (85.0 mL, 677 mmol) are heated in a sealed reaction vessel from room temperature to 200 °C over 2.5 hours, at 280-300 °C for 2 hours, and is allowed to cool to room temperature. The reaction mixture is distilled (1.5 mm, 130-144 °C) to yield 107 g of the title compound which solidified upon standing (mp 50.5-52.5 °C).

Resolution of *tert*-butyl 3-(2-methylpropyl)-2-oxo-1-(2-phenylethyl)-3-pyrrolidineacetate. A solution of 50 mg/mL of racemic *tert*-butyl 3-(2-methylpropyl)-2-oxo-1-(2-phenylethyl)-3-pyrrolidineacetate (EXAMPLE 1, step 3) is made in the mobile phase that consisted of 10% isopropanol in hexane (V/V). Aliquots of 3.5 mL (175 mg) are injected onto a 2.1x25 cm Chiralpak AD column (Chiral technologies, Inc.). The column is eluted at 10 mL/min and monitored at 220 nm. The two enantiomers are collected using a peak recognition program and fractions are pooled appropriately. Each enantiomer is obtained at >99% ee. Enantiomeric excess is determined on a 0.46x25 cm Chiralpak AD column (Chiral Technologies, Inc.), developed with the same solvent at 0.5 mL/min and the monitor set at 220 nm. The

retention times here are 12.2 and 23.0 minutes ($\alpha = 2.61$).

Following the general procedure outlined in EXAMPLE 1 (steps 4-5), and making non-critical variations but starting with (S)-*tert*-butyl 3-(2-methylpropyl)-2-oxo-1-(2-phenylethyl)-3-pyrrolidineacetate (the faster eluting enantiomer described above), the title compound is obtained.

 15 injected onto a 5.1x50 cm Chiralcel OD column (Chiral Technologies, Inc., Exton, PA 19341) using a SepTech 140 HPLC (EM Separations, Inc., Wakefield, RI 02880) instrument in the automated peak shaving and recycling mode. The flow rate is 60 mL/min and the monitor is set at 213 nm. After four passes through the column with appropriate peak shaving, both peaks are obtained in nearly 100% yield at
 20 >99% ee for the earlier eluting enantiomer (enantiomer 1) and 96.4% ee for the later eluting enantiomer (enantiomer 2). Enantiomeric excess is determined on a 0.46 x 25 cm Chiralcel OD-H column (Chiral Technologies, Inc.) using 5% isopropanol in hexane (V/V) at 0.5 mL/min with the monitor set at 210 nm. Enantiomer 1 eluted at 8.8 minutes and enantiomer 2 eluted at 10.2 minutes ($\alpha = 1.42$).

The combined organic layers are dried over anhydrous Na₂SO₄, filtered, and concentrated under reduced

The oil is purified by silica gel chromatography (50 g SG, packed and eluted with a gradient of 0-40% EtOAc/hexane) to give 162 mg (18%) of the hydantoin intermediate as an oil. The material is sufficiently pure to be carried on: ^1H NMR (300 MHz, CDCl_3) δ 7.90-8.60, 7.20-7.40, 5.75-5.95, 5.25-5.40, 3.15-3.30, 3.05-3.15, 2.60-2.90, 1.80-2.00, 0.90-1.05.

Once the black solution has turned green, NaHCO_3 (2.17 g, 25.8 mmol) is added, followed by the further addition of NaIO_4 until the solution became green again. A solution of the hydantoin intermediate (155 mg, 0.516 mmol) in 3 mL CH_3CN is added to the green mixture. After 5 minutes, the reaction mixture is quenched with H_2O and extracted with EtOAc several times. The aqueous layer is acidified with 6 N HCl and then extracted twice with CH_2Cl_2 (2 x) and EtOAc (2 x). The organic layers are combined, washed again with brine, dried over anhydrous Na_2SO_4 , filtered, and concentrated under reduced pressure to yield 79 mg of the title compound as a solid. Additional title compound is recovered by washing the original EtOAc extracts with 10% NaOH, acidifying the aqueous with 6 N HCl, and re-extracting with CH_2Cl_2 (3 x). These extracts are also combined, washed again with brine, dried over anhydrous Na_2SO_4 , filtered, and concentrated under reduced pressure to yield an additional 64 mg of the title compound. Both crops are dissolved in CH_2Cl_2 , combined, filtered through a fine frit, and concentrated under reduced pressure to give a total of 143 mg (87%) of the title compound as a solid.

The mixture is stirred for 12 hours at room temperature and is diluted with EtOAc. The solution is washed with saturated NaHCO_3 , 1 N HCl, saturated NaHCO_3 , and brine. The organic layer is dried over anhydrous Na_2SO_4 , filtered, and concentrated
